

Line 6

Helix Native

1. GET HELIX NATIVE

Helix Native is Line 6's Helix plugin for your DAW. Sign in with a free Line 6 account and download the installer from the Line 6 Software page below. Pick Helix Native, not Helix Stadium Native. Insert it on a track, then buy a license or start the free trial.

[Download Helix Native](#)

2. BACK UP FIRST

Click the gear icon in the lower left, select the **Presets/IRs** tab and click **Export Bundle** to save your whole preset library. In HX Stomp mode, click **Export Setlist** in the Presets panel instead.

3. LOAD YOUR PRESETS

Unzip your download. Skip any __MACOSX folder and files starting with .__ (Mac leftovers). In the Presets panel, select a slot you do not need, click **Import** and pick a .hlx file from the Presets folder, or drag the file onto a slot. HX Stomp presets? If asked, switch to the matching HC mode.

4. TEST OUT YOUR NEW PRESETS

Double-click the preset to load it. Pick a snapshot from the **Snapshots** menu at the top of the plugin. Share a clip? Tag the artist!

Troubleshooting Tips

In the plugin, hardware inputs and outputs switch to Host, and footswitch and expression pedal assignments do nothing. Snapshots and MIDI assignments still work.

Import error? Presets made on newer versions will not load on older ones, so update Helix Native.

IR alert? Import the IRs your pack's manual names in the **IRs** panel.
