1. GET HX EDIT

HX Edit is Line 6's free editor for Helix Floor, LT and Rack. Download it from the [Line 6 Software](#) page below (free account needed). Connect Helix by USB and open HX Edit. If it offers updates, click **Update Now**. It updates HX Edit, backs up Helix, then updates the firmware.

2. BACK UP FIRST

Just updated? Do the factory reset HX Edit asks for, then choose **File > Restore From Backup...**, pick your backup and click **Restore Backup**. No update? Choose **File > Create Backup...** and click **Create Backup**.

3. LOAD YOUR PRESETS

Pick a setlist in the **Setlist** menu and click an empty **New Preset** slot. Drag the .hlx file from your download's Presets folder onto it, or choose **File > Import Preset...**, click **Yes** and pick the file.

4. TEST OUT YOUR NEW PRESETS

Double-click the preset to load it. On Helix Floor or LT, press both **BANK** switches together for Snapshot mode, then press a switch to pick a snapshot. Share a clip? Tag the artist!

Troubleshooting Tips

No device detected? Use a USB 2.0 or faster port, not a hub. Windows needs the drivers included with HX Edit.

Import error? Presets made on newer firmware will not load on older firmware, so update HX Edit and your firmware.

These presets are too big for HX Stomp or HX Effects.

Missing IR alert? Your pack's manual names the IRs to add.
