

Kemper

Profiler

1. GET RIG MANAGER AND UPDATE

Rig Manager is Kemper's free editor for Mac and Windows. Download it below, connect your Profiler's USB type B port to your computer and open Rig Manager. If it offers a Profiler update, make the backup in step 2 first, then accept it.

2. BACK UP YOUR PROFILER

Kemper's full backup is made on a USB stick, not in Rig Manager. Plug a stick into the Profiler's USB type A port and wait for **USB Stick** to show on screen. In Browse Mode, press **USB Stick**, choose **Backup/Restore**, then **Backup**. Profiler Player: plug the stick in while it is running, then power it off and back on while holding **BANK**.

3. LOAD YOUR RIGS

Unzip your download first. In Rig Manager, click **Local Library** in the Locations list on the left. Drag the rig files from the Presets folder into the list. Then select them and drag onto **MyProfiler** to store them on your amp. Skip any **_MACOSX** folder and files starting with **_** (Mac leftovers, not rigs).

4. TEST OUT YOUR NEW RIGS

You are good to go! Pick a rig and play through the sounds. If you share a clip, tag the artist so they can hear how you are using their rigs.

Troubleshooting Tips

No computer nearby? On a Head, Rack or Stage, copy the rigs into the Shared folder on your USB stick, plug it in, and press **USB Stick** to import them.
